Less is more.

Surface-finished stencils from BECKTRONIC – The sustainable solution

BECchem is a long-established method that has proven itself and established itself in surface treatment. With the application of this process technology, we have been achieving the best results for decades and at the same time creating the basis for the highest stencil quality.

The BECchem electro-galvanic chemical treatment reduces the roughness of the apertures edges from 3 μm to under 1 μm Rz. But the differences are not only clear in qualitative terms. BECchem reduces the cleaning effort for surfaces to a minimum - this saves time and money.

BECchem achieves optimal results with controlled production:

- Efficient printing of small designs
- Reduction of the „surface roughness“ of the pad inner walls
- Paste/adhesive applications have more constant print packages
- Cost savings by cutting down consumable materials
- Reduction of the cleaning cycles/increase in productivity
- Optimized release properties of soldering pastes and glue

BECKTRONIC - comprehensive advice and short delivery times

Standard delivery times of one day – no additional fee or express surcharge
Free 4 hours express service – for quick-tensioning and prototype stencils
(for orders received before 3 pm)

BECKTRONIC
perfect. stencils.
